INTRODUCTION:

The **Shoe Store Management System** is a web-based application designed to manage and automate the operations of a shoe retail business. The system provides an efficient platform for managing products, customers, orders, and payments in a structured and organized manner.

In today's digital era, online shopping has become an essential part of business operations. Manual management of shoe inventory, customer records, and order processing can be time-consuming and prone to errors. This system aims to overcome these challenges by providing a centralized and computerized solution.

The system is divided into two main modules:

CUSTOMER MODULE:

Customers can register, login, browse different shoe categories, view product details, add items to the cart, place orders, and make payments online. The system also allows customers to track their orders and view order confirmations.

ADMIN MODULE:

The admin is responsible for managing the overall system. The admin can add, update, or delete categories, brands, and shoe products. The admin can also manage customer orders and update order statuses.

The system ensures proper data storage using a structured database design, maintaining relationships between users, products, orders, and payments. It improves efficiency, reduces manual errors, enhances customer experience, and provides better business control.

Overall, the Shoe Store Management System provides a reliable, secure, and user-friendly solution for managing an online shoe store.
